

A Note About the Next Lesson: Google SMTP Port

In the next lesson, we will show you how to send email using the `smtplib` module and Python. If you are getting the error Connection unexpectedly closed, it might be due to a number of things. You can come back to this lesson to debug.

```
File "/Library/Frameworks/Python.framework/Versions/3.8/lib/python3.8/smtplib.py", line 253, in __init__
    (code, msg) = self.connect(host, port)
File "/Library/Frameworks/Python.framework/Versions/3.8/lib/python3.8/smtplib.py", line 341, in connect
    (code, msg) = self.getreply()
File "/Library/Frameworks/Python.framework/Versions/3.8/lib/python3.8/smtplib.py", line 398, in getreply
    raise SMTPServerDisconnected("Connection unexpectedly closed")
smtplib.SMTPServerDisconnected: Connection unexpectedly closed

Process finished with exit code 1
```

1. Make sure you have got the correct smtp address for your email provider:

- Gmail: smtp.gmail.com
- Hotmail: smtp.live.com
- Outlook: outlook.office365.com
- Yahoo: smtp.mail.yahoo.com

If you use another email provider just Google for your email provider e.g. "Gmail SMTP address"

Below are steps specific to users sending email from Gmail addresses.

2. Go to <https://myaccount.google.com>

Select Security on the left and scroll down to **How you sign in to Google**.

Enable 2-Step Verification

3. Find the section on **App Passwords** by searching for it:

There you can add an **App password**.

Select give your app a name e.g., Python Mail and click **create**.

← App passwords

App passwords help you sign in to your Google Account on older apps and services that don't support modern security standards.

App passwords are less secure than using up-to-date apps and services that use modern security standards. Before you create an app password, you should check to see if your app needs this in order to sign in.

[Learn more](#)

You don't have any app passwords.

To create a new app-specific password, type a name for it below...

App name
Python Mail

Create

COPY THE PASSWORD - This is **the only time** you will ever see the password. It is 16 characters with no spaces.

Use this App password in your Python code instead of your normal password.

- By default `smtplib.SMTP` uses port 25. This used to be the standard SMTP port, but because of abuse in the past most servers nowadays have blocked this port to external traffic. There are still some that do allow it; Hotmail, Live, etc. Port 25 is still used for traffic between servers, but many providers have switched to using port 587 for external traffic. If in doubt, search the internet "smtp server settings" for your provider.

Add a port number by changing your code to this:

```
smtplib.SMTP("smtp.gmail.com", port=587)
```
